

SMTPServer library usage documentation

The purpose of this library is to create an SMTP server that easily implements RFC5321.

First you need to introduce the smtpclient library

```
from SMTPServer import SMTPServer
```

Secondly, you need to create a client object

```
Server = SMTPServer(host, port)  
Server.start_server()
```

Third step, use the client to send a request to the server

Note: To use this library, please download and properly configure the dnspython package first

Please refer to the smtpclient documentation for more information.
